

# Course Project – Group Assignments

## Cell & Tissue Engineering (CTE)

### Overview

Complete the course project assignments with your randomly assigned partner. Only one person from each group should submit via blackboard or the discussion board, but each submission or post should include both student names.

### Guide for Working as Group

- As you plan for this course project, the first step as a team is for the group to appropriately divide the workload. This planning will help both members be both held accountable to their initial commitments as well as so the group can begin delegating tasks and working as a team towards the final presentation. At this stage of your careers, we expect that all members can be relied upon to contribute fairly to a team project. The deliverables and content requirements are in the Course Project Overview document and the individual assignments.
- We DO NOT recommend dividing the work based on the deliverables posted in the outline. Certain milestones require much more work than others. Instead, based on the topic area selected draft out what types of research is required and what information needs to be gathered for the future assignments.
- Due to the nature of this course, it is likely that members of your group will be several time zones away or even on the other side of the planet. This assignment is a good opportunity to strategize as a team how these obstacles will be overcome to “shepherd” your device to the mock FDA.
